

(3.1) Why is the program counter a pointer and not a counter?

Counters are relative to a certain point, which would have to be specified in another point. The pointer is similar to a counter, only with the starting point located at the start or end of memory depending on the system. A pointer is also used because of branch / jump statements that cause the pointer to move in a non-sequential manner.

(3.2) Explain the function of the following registers

- (a) PC: program counter, keeps track of the location of the next instruction to be executed
- (b) MAR: Memory Address Register: stores the address of the data to be retrieved or stored
- (c) MBR: Memory Buffer Register: stores the data to be loaded or stored
- (d) IR: Instruction Register: stores the current fetched instruction

(3.3) (a) c = 0 z = 0 v = 0 n = 0

(b) c = 1 z = 1 v = 0 n = 0

(c) c = 0 z = 0 v = 0 n = 0

(d) c = 1 z = 0 v = 0 n = 0

(e) c = 0 z = 0 v = 0 n = 1

(f) c = 1 z = 0 v = 1 n = 0

(3.10) Why does ARM implement a reverse subtract?

Because literals can only be stored operand 2, so this allows the programmer to subtract from a literal.

(3.17) What are the advantages and disadvantages of storing the 12 bit literal as an 8 bit literal and a 4 bit shift?

This allows for a greater range of values the literal, but gives less precision, especially when moving further from zero.

(3.18) Write one or more ARM instructions that will clear bits 20 to 25 inclusive in register 0.

AND R0, R0, #0xfe0ffff

(3.19) Swap without an extra register.

EOR R0, R0, R1

EOR R1, R0, R1

EOR R0, R0, R1

(3.25) What is the binary encoding for the given instructions?

(a) 1110 0110 0100 0000 0000 0000 0000 0000

(b) 1110 0111 1011 0011 0100 0000 0000 0101

(c) 1110 0110 1011 0011 0100 0000 0000 0101

(d) 1110 0111 0011 0011 0100 0011 0000 0000

(3.39) Copy a string from one location to another

```
START:
LDRB r2, [r0], #1
STRB r2, [r1], #1
TEQ R2, #0
BRNE START
```

(3.51) test for palindromes

```
START:
MOV r0, #1
TEQ r1, r2
BREQ END
LDRB r3, [r1], #1
LDRB r4, [r2], #-1
TEQ r3, r4
BRNE NO
B START
```

```
NO:
MOV r0, #0
END:
```
